

PRODUCT DATA SHEET

Phosphatidylethanolamine, bovine

Catalog number: 1069

Common Name: PE

Source: natural, bovine

Solubility: chloroform

CAS No: 90989-93-8

Molecular Formula: C₄₁H₇₈NO₈P

Molecular Weight: 744 (oleoyl)

Storage: -20°C

Purity: TLC > 98%

TLC System: chloroform/methanol/DI water,
(65:25:4 by vol.)

Appearance: liquid

Application Notes:

Phosphatidylethanolamine (PE) is frequently the main lipid component of microbial membranes and the second most abundant phospholipid in mammals, comprising as much as 45% of brain lipids. They are concentrated in mitochondria and are key building blocks of membrane bilayers where they are distributed asymmetrically with the majority confined to the inner leaflet. It appears that a primary role for PE, in bacterial membranes at least, is simply to dilute the high negative charge density of the anionic phospholipids. PE acts as a chaperone in transport membrane folding.¹ In animals, PE is involved in the secretion of very-low-density lipoproteins and aids in membrane fusion and fission.² In plants, *lyso* PE retards senescence by inhibiting phospholipase D. PE is the precursor to many important lipids. PE acts as a protein transport from the membrane to diacyl glycerol as a second messenger.³
