

PRODUCT DATA SHEET

Disialoganglioside GD₂ (NH₄⁺ salt), rabbit

Catalog No: 1527

Common Name: GD₂

Source: semisynthetic, rabbit

Solubility: chloroform/methanol/DI water (2:1:0.1);
forms micellar solution in water

CAS No: 65988-71-8

Molecular Formula: C₇₈H₁₃₈N₄O₃₄ • 2NH₃
(steroyl; d18:1 sphingoid base)

Molecular Weight: 1676+2NH₃

(stearoyl; d18:1 sphingoid base)

Storage: -20°C

Purity: TLC: >98%; identity confirmed by MS

TLC System: chloroform/methanol/2.5N ammonium
hydroxide (60:40:9 by vol.)

Appearance: solid

Application notes:

As this product is derived from a natural source, there may be variations in the sphingoid backbone.

Gangliosides¹ are acidic glycosphingolipids that form lipid rafts in the outer leaflet of the cell plasma membrane, especially in neuronal cells in the central nervous system.² They participate in cellular proliferation, differentiation, adhesion, signal transduction, cell-to-cell interactions, tumorigenesis, and metastasis. The accumulation of gangliosides has been linked to several diseases including Tay-Sachs and Sandhoff disease and cancer.

Disialoganglioside GD₂ is normally found mostly in the central nervous system and in low amounts in peripheral nerves and skin melanocytes. However in various cancers aberrant glycosylation produces relatively high amounts of GD₂ on tumor cell surfaces and has been shown to enhance tumor proliferation and metastasis. The relatively tumor specific expression of GD₂ makes it a good candidate for immunotherapy using anti-GD₂ antibodies and this approach has been actively pursued for the past several decades.^{3,4}
