

PRODUCT DATA SHEET

N-Tetracosanoyl-D-erythro-sphingosine

Catalog number: 1916

Common Name: N-C24:0-D-erythro-Ceramide; N-Lignoceroyl-D-erythro-sphingosine

Source: synthetic

Solubility: chloroform

CAS number: 34435-05-7

Molecular Formula: C₄₂H₈₃NO₃

Molecular Weight: 650

Storage: -20°C

Purity: TLC >98%, GC >98%; identity confirmed by MS

TLC System: chloroform/methanol (95:5 by vol.)

Appearance: solid

Application Notes:

This product is a high purity ceramide that is ideal as a standard and for biological systems. It is a ceramide containing the long chain lignoceric acid and is common in some mammalian tissues such as the brain. Ceramide is a fatty acid amide of sphingosine. Ceramide functions as a precursor in the synthesis of sphingomyelin, glycosphingolipids, and of free sphingosine and fatty acids. The sphingosine can be phosphorylated to form sphingosine-1-phosphate. Two of ceramide's metabolites, sphingosine-1-phosphate and glucosylceramide, produce cell proliferation and other cellular functions.¹ Ceramide exerts numerous biological effects, including induction of cell maturation, cell cycle arrest, terminal cell differentiation, cell senescence, and cell death.² Because of these effects ceramide has been investigated for its use in cancer treatment and many potential approaches to cancer therapy have been presented.³ Other effects include producing reactive oxygen in mitochondria (followed by apoptosis) and stimulating phosphorylation of certain proteins (especially mitogen activated protein). It also stimulates some protein phosphatases (especially protein phosphatase 2A) making it an important controller of protein activity.
