

PRODUCT DATA SHEET

N-omega-CD₃-Octadecanoyl monosialoganglioside GM₂ (NH₄⁺ salt)

Catalog number: 2051

Common Name: N-D₃-Stearoyl-GM₂

Source: semisynthetic, human Tay-Sachs

Solubility: chloroform/methanol/DI water,
2:1:0.1; forms micellar solution in
water

CAS number: N/A

Molecular Formula: C₆₇H₁₁₈D₃N₃O₂₆ • NH₃

Molecular Weight: 1388+NH₃

Storage: -20°C

Purity: 98⁺%; identity confirmed by MS

TLC System: chloroform/methanol/
2.5N aqueous ammonium
hydroxide, (60:40:9 by vol.)

Appearance: solid

Application Notes:

This deuterated ganglioside is ideal for the identification of gangliosides in samples and biological systems using mass spectrometry.¹ Gangliosides² are acidic glycosphingolipids that form lipid rafts in the outer leaflet of the cell plasma membrane, especially in neuronal cells in the central nervous system.³ They participate in cellular proliferation, differentiation, adhesion, signal transduction, cell-to-cell interactions, tumorigenesis, and metastasis.⁴ GM₂ regulates the function of ciliary neurotrophic factor receptors. The accumulation of GM₂ (due to a deficiency in *beta*-hexosaminidase) has characterized Tay-Sachs disease (due to a mutation in the gene *HEXA*) and Sandhoff disease (due to a mutation in the gene *HEXB*). A mutation in the *GM2A* gene results in GM₂ activator deficiency that also leads to accumulation of GM₂.⁵
