

PRODUCT DATA SHEET

N-Heptadecanoyl-D-erythro-dihydrosphingosine

Catalog number: 2083

Synonyms: N-C17:0-D-erythro-Dihydroceramide;
N-Heptadecanoyl-D-erythro-sphinganine

Source: synthetic

Solubility: chloroform/methanol 5:1, hot
ethanol, DMSO

CAS number: 1388156-40-8

Molecular Formula: C₃₅H₇₁NO₃

Molecular Weight: 554

Storage: -20°C

Purity: TLC: >98%; HPLC: >99%; identity
confirmed by MS

TLC System: chloroform/methanol (90:10 by vol.)

Appearance: solid

Application Notes:

This product is a high purity, well-defined dihydroceramide that is ideal as an internal standard and in biological systems. Dihydroceramide is a critical intermediate in the *de novo* synthesis of ceramide, leading to many complex sphingolipids. It is synthesized by the acylation of sphinganine and is subsequently converted to ceramide *via* the enzyme dihydroceramide desaturase or into phytosphingosine *via* the enzyme C4-hydroxylase.¹ Inhibition of ceramide synthase by some fungal toxins (such as fumonisin B1) causes an accumulation of dihydrosphingosine and sphinganine-1-phosphate and a decrease in dihydroceramide and other dihydrosphingolipids, leading to a number of diseases including oesophageal cancer.² The dihydroceramide desaturase inhibitor N-(4-Hydroxyphenyl) retinamide (4-HPR) has been tested as an anti-cancer agent. It inhibits the dihydroceramide desaturase enzyme in cells resulting in a high concentration of dihydroceramide and dihydro-sphingolipids and this is thought to be the cause of its anti-cancer effects.³ Oxidative stress in cells causes an increase in the amount of dihydroceramide by potently inhibiting the desaturase enzyme.⁴ Dihydroceramide inhibits the formation of channels by ceramides and may thus reduce ceramide induced apoptosis in cells.⁵ While ceramide is well known for promoting apoptosis, dihydroceramide has long been considered to be inactive. However, there has recently been evidence that an accumulation of dihydroceramide can induce cell cycle arrest.⁶
